Started on	Tuesday, 28 May 2024, 1:29 PM
State	Finished
Completed on	Tuesday, 28 May 2024, 2:03 PM
Time taken	34 mins 49 secs
Marks	5.00/5.00
Grade	100.00 out of 100.00

```
Question 1
Correct
Mark 1.00 out of 1.00
```

Given an array of names of candidates in an election. A candidate name in the array represents a vote cast to the candidate. Print the name of candidates received Max vote. If there is tie, print a lexicographically smaller name.

Examples:

Output : John

We have four Candidates with name as 'John', 'Johnny', 'jamie', 'jackie'. The candidates John and Johny get maximum votes. Since John is alphabetically smaller, we print it. Use <u>dictionary</u> to solve the above problem

Sample Input:

10

John

John

Johny

Jamie Jamie

Johny

Jack

Johny

Johny

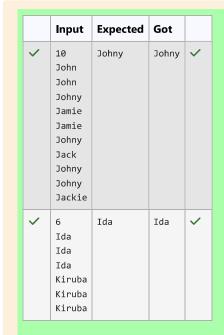

Jackie

Sample Output:

Johny

```
1 v def findWinner(votes):
2     vote_count = {}
3     for name in votes:
```

```
TOP Hame IN VOLES:
 4 🔻
            if name in vote_count:
                vote_count[name] += 1
 5
 6
            else:
 7
                vote_count[name] = 1
 8
        max\_votes = 0
        winner = ""
 9
10
        for name, count in vote_count.items():
11 1
            if count > max_votes:
12
                max_votes = count
13
                winner = name
14
            elif count == max_votes and name < winner:</pre>
15
                winner = name
16
        return winner
17
   n = int(input())
18
19
   votes = []
20
   for _ in range(n):
21
        name = input().strip()
22
        votes.append(name)
23
   print(findWinner(votes))
```

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

```
Question 2

Correct

Mark 1.00 out of 1.00
```

Create a student <u>dictionary</u> for n students with the student name as key and their test mark assignment mark and lab mark as values. Do the following computations and display the result.

- 1.Identify the student with the highest average score
- 2.Identify the student who as the highest Assignment marks
- 3.Identify the student with the Lowest lab marks
- 4.Identify the student with the lowest average score

Note

If more than one student has the same score display all the student names

Sample input:

4

James 67 89 56

Lalith 89 45 45

Ram 89 89 89

Sita 70 70 70

Sample Output:

Ram

James Ram

Lalith

Lalith

For example:

Input	Result
4	Ram
James 67 89 56	James Ram
Lalith 89 45 45	Lalith
Ram 89 89 89	Lalith
Sita 70 70 70

Correct

Marks for this submission: 1.00/1.00.

```
Question 4
Correct
Mark 1.00 out of 1.00
```

A sentence is a string of single-space separated words where each word consists only of lowercase letters. A word is uncommon if it appears exactly once in one of the sentences, and does not appear in the other sentence.

Given two sentences s1 and s2, return a list of all the uncommon words. You may return the answer in any order.

Example 1:

Input: s1 = "this apple is sweet", s2 = "this apple is sour"

Output: ["sweet", "sour"]

Example 2:

Input: s1 = "apple apple", s2 = "banana"

Output: ["banana"]

Constraints:

1 <= s1.length, s2.length <= 200

s1 and s2 consist of lowercase English letters and spaces.

s1 and s2 do not have leading or trailing spaces.

All the words in s1 and s2 are separated by a single space.

Note:

Use dictionary to solve the problem

For example:

Input	Result
this apple is sweet this apple is sour	sweet sour

```
1 v def uncommon_words(s1, s2):
 2
        word_counts = {}
 3 1
        for word in s1.split():
            if word in word counts:
 4
 5
                word_counts[word][0] += 1
 6
            else:
 7
                word_counts[word] = [1, 0]
 8 ,
        for word in s2.split():
 9
            if word in word counts:
10
                word_counts[word][1] += 1
11
            else:
12
                word_counts[word] = [0, 1]
        uncommon = [word for word, counts in word_counts.items() if counts[0] == 1 and counts[1] == 0 or counts[0] ==
13
14
        return uncommon
15
16
    s1 = input()
17
    s2 = input()
18
    result = uncommon_words(s1, s2)
    print(" ".join(result))
19
20
```

	Input	Expected	Got	
~	this apple is sweet this apple is sour	sweet sour	sweet sour	~
~	apple apple banana	banana	banana	~

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

```
Question 5
Correct
Mark 1.00 out of 1.00
```

In the game of Scrabble[™], each letter has points associated with it. The total score of a word is the sum of the scores of its letters. More common letters are worth fewer points while less common letters are worth more points. The points associated with each letter are shown below:

Points Letters

1 A, E, I, L, N, O, R, S, T and U

2 D and G

3 B, C, M and P

4 F, H, V, W and Y

5 K

8 J and X

10 Q and Z

Write a program that computes and displays the ScrabbleTM score for a word. Create a <u>dictionary</u> that maps from letters to point values. Then use the <u>dictionary</u> to compute the score.

A Scrabble™ board includes some squares that multiply the value of a letter or the value of an entire word. We will ignore these squares in this exercise.

Sample Input

REC

Sample Output

REC is worth 5 points.

For example:

In	put	Res	ult			
RE	С	REC	is	worth	5	points.

```
1 def scrabble_score(word):
 2 🔻
        points = {
            'A': 1, 'E': 1, 'I': 1, 'L': 1, 'N': 1, 'O': 1, 'R': 1, 'S': 1, 'T': 1, 'U': 1,
